INSTRUCTIONS TO AUTHORS

Letters are intended as brief reports of significant, original and timely research results in the field of chemical physics which warrant rapid publication. In considering the suitability of a manuscript for publication, the editors pay particular attention to the originality of the research, the desirability of speedy publication, and the validity of the conclusions.

Submission: Contributions, written in English, should be sent to one of the editors or, preferably, to a member of the advisory editorial board who is familiar with the research reported who will transmit the manuscript with recommendations to the editors. All manuscripts should be submitted in triplicate, of which one is a clear copy with master figures (see below).
The full addresses of the members of the Advisory Editorial Board will be found at the beginning of every volume.

Refereeing: All contributions submitted will be refereed. The editors reserve the right to reject manuscripts and to edit contributions when necessary.

Comments section: The editors welcome comments on Letters published in the Journal or elsewhere. They will be placed in a separate section. Comments will be refereed as usual and treated as normal contributions. All Comments should have an abstract.

Publication speed: The editors and publishers cooperate closely to ensure minimal publication delays. All proofreading will be done by the publishers and proofs are not sent to the author(s). If the manuscript submitted cannot be processed immediately because scientific revisions are required or because of the author's failure to meet the length and stylistic requirements (see below), the delay thus resulting will be indicated by the addition of the date of receipt of the manuscript *in final form.*

Publication scheme: Chemical Physics Letters will be published weekly.

Page charge and reprints: There is no page charge. Reprints may be ordered from the publisher; an order form is sent to contributors upon acceptance of their Letter.

Copyright transfer: Upon acceptance of an article, the author(s) will be asked to transfer copyright of the article to the publisher. This transfer will ensure the widest possible dissemination of information.

Correspondence: All correspondence with the editors or publishers should contain full reference to the paper concerned, i.e. the names of all the authors, the full title, as well as the date of submission. Once the contribution has been accepted for publication, all further correspondence should be sent directly to the publishers and not to the editors (Drs. M.D. Nauta, Editorial Department, North-Holland Physics Publishing, P.O. Box 103, 1000 AC Amsterdam, The Netherlands; telephone number (020)-5862629 or 31-20-5862629 for international access, FAX (020)-5862580 or 31-20-5862580 for international access, telex number 10704 espom nl, electronic mail: Dialcom/Tgold/Memocom System 27:ESX 010).

Preparation of manuscripts: The following are the stylistic requirements for an acceptable manuscript.

(1) *Title*: The title should be brief (normally less than 20 words) and yet convey to the informed reader the nature of the contents of the paper.

(2) *Address*: The name(s) of the author(s) and the name and address of the institute where the research work was done should be indicated on the manuscript. The name of the author to whom correspondence is to be addressed should be underlined.

(3) *Abstract*: An abstract of length not to exceed 100 words is required. It should contain the keywords of the paper as well as the essence of the results.

(4) *Length*: Manuscripts should normally not exceed the equivalent of 2500 words including tables, plus references and figure captions, and no more than five figures. They should be typed double-spaced with a wide margin. All pages should be numbered.

(5) *Symbols and Units*: The use of SI units is strongly recommended. Authors will find the "green book" – Quantities, units and symbols in physical chemistry, prepared by I. Mills, T. Cvitas, K. Homann, N. Kallay and K. Kuchitsu (Blackwell Scientific Publications, for IUPAC, Oxford, 1988) – a useful guide.

(6) *Figures*: The drawings for the figures should be of high contrast and carefully lettered and submitted on separate sheets. The lettering as well as the essential details should have proportionate dimensions so as to be legible after the usual reduction by the printers (ideal lettering size after reduction of the drawing to one-column width is 1.8 mm). The drawings should preferably be of the same size as the typescript and designed for a reduction factor in print of two or three. Each drawing should have a figure number and a caption; the captions should be collected on a separate sheet. The appropriate place of each figure in the text should be indicated in the margin.

(7) *Colour illustrations*: Illustrations in colour will be accepted where the use of colours is essential for the presentation. The decision on this rests with the Editor. The Publisher and the Author will each bear part of the extra costs involved. These arise from (a) the need to prepare colour-separated printing films by means of scanning the original colour figures (figure processing costs), and (b) the need to print four colours (printing costs). The figure processing costs are typically on a per figure basis. Printing costs are independent of the number of colour illustrations per page, but are dependent on the number of pages containing colour figures. Authors will be billed in Dutch Guilders (Dfl.) according to the following rates: printing costs are Dfl. 1200 for the first page and Dfl. 200 for additional pages; figure processing costs are Dfl. 200 per figure. Where combined scanning can be used, the cost is reduced by 15% (if two figures are combined) up to more than 50% (if eight figures are combined). For computer colour prints involving no more than four colours and no differentiation of shades, no figure processing costs will be charged if colour-separated originals are submitted. On each such original, register marks must be clearly indicated so as to ensure exact positioning of each colour when printing. There will be *no* additional charge for reprints containing colour illustrations. Colour illustrations should be submitted as original colour photographs, transparencies, or 35 mm slides. Polaroid colour prints are not suitable. Please submit colour photographs and transparencies close to the size expected in publication.

(8) *Formulae*: Displayed formulae should be numbered and typed or clearly and unambiguously written by hand. Symbols requiring bold-face type, like vectors, etc., should be identified properly in the margin of the manuscript. Long equations should be avoided as much as possible by introduction of suitable abbreviations of component expressions. Special attention should be paid to symbols that can easily be misread, such as i (lower case), I (cap.), l (el), 1 (one), ′ (prime), o (lower case), O (cap.), 0 (zero), ° (degree), u, v (vee), ν (Greek nu), V (cap.), x, $\times$, X, z, Z, p, P, ρ (Greek rho), etc.

(9) *Tables*: Tables should be typed on separate sheets and each table should have a number and a title. The appropriate places for the insertion of the tables should be indicated in the margin.

(10) *References*: In the text, reference to other parts of the paper should be made by section (or equation) number, not by page number. References to other papers should be consecutively numbered in the text and should be listed numerically on a separate sheet at the end of the paper. The references should be as complete as possible and be presented as follows:

For a book:

A. Messiah, Quantum mechanics, Vol. 2 (North-Holland, Amsterdam, 1970).

For a paper in a journal:

I. Kaplan and J. Jortner, Chem. Phys. 32 (1978) 381.

For a paper in a contributed volume:

G.L. Hofacker, Y. Maréchal and M. Ratner, in: The hydrogen bond, Vol. 1, eds. P. Schuster, G. Zundel and C. Sandorfy (North-Holland, Amsterdam, 1976) p. 295.

For an unpublished paper:

R.L. Swofford, Ph.D. Thesis, University of California, Berkeley (1973) p. 76.

(11) *Footnotes*: Footnotes should normally have no extensive use of mathematical symbols. They should be placed in the text where required and used sparingly.

Intermolecular Complexes

The Role of van der Waals Systems in Physical Chemistry and in the Biodisciplines

by **P. Hobza,** *Institute of Hygiene and Epidemiology, and* **R. Zahradník,** *Institute of Physical Chemistry and Electrochemistry of the Czechoslovak Academy of Sciences, Prague, Czechoslovakia*

(Studies in Physical and Theoretical Chemistry, 52)

Intermolecular complexes play an important role in physical chemistry, molecular physics and, especially, in the biodisciplines. In the early 1980s, rapid and significant progress was made in both experimental and theoretical investigations of molecular interactions - a fact which encouraged the authors to prepare this monograph.

The coverage is comprehensive, ranging from theory to experiment, from interactions of small systems to very large systems, as well as interactions of large numbers of systems, and from chemical to biological applications.

The book is written for students and scientists working in various areas of chemistry, biology and physics. Readers will benefit from the fact that quantum and other theories of molecular interactions, experimental investigations of molecular interactions, and applications in physical chemistry and biodisciplines are consistently covered within a single book. Different computational techniques are analysed and concrete recommendations of computational strategy made for the treatment of van der Waals systems of various size.

Contents: I. Introduction. II. Methods of Calculating Weak Interactions. III. Experimental Methods Yielding Information on Weak Intermolecular Interactions. IV. Applications in Molecular Physics and Chemistry. V. Applications in the Biodisciplines. References. Appendix. Index.

CHEMICAL PHYSICS LETTERS

Volume 156, number 6, 21 April 1989

CONTENTS

Measurement of magnetic circular dichroism (MCD) on a nanosecond timescale
R.A. Goldbeck, T.D. Dawes, S.J. Milder, J.W. Lewis and D.S. Kliger 545

A comparison between the confined rotator model and experimental orientational correlation functions for N_2O dissolved in liquid SF_6
K. Pasterny and A. Kocot 550

Infrared laser absorption studies of jet-cooled nickel tetracarbonyl
P.B. Davies, N.A. Martin, M.D. Nunes, D.A. Pape and D.K. Russell 553

Free-jet high-resolution FTIR spectroscopy of the complex structure of the ν_1 band of CF_3I near 9 μm
H. Bürger, A. Rahner, A. Amrein, H. Hollenstein and M. Quack 557

Radiative lifetime of the Te_2 $A(0_u^+)$ state studied by laser-induced fluorescence
E. Martínez, P. Puyuelo, F.J. Basterrechea and M.T. Martínez 564

Fluorescence excitation spectra of the XeCl(B, C) states in a supersonic jet
C. Jouvet, C. Lardeux-Dedonder and D. Solgadi 569

Collision of SF_6 molecules with Xe(nf) Rydberg atoms in a quadrupole trap. Dependence of the SF_6^- ion lifetime on n
G. Brincourt, S. Rajab Pacha, R. Catella, Y. Zerega and J. André 573

Infrared spectroscopy of the HCN–$(HF)_2$ ternary complex
D.C. Dayton and R.E. Miller 578

Long-range second-order interactions and the shape of the He–HF and Ne–HF complexes
V. Magnasco, C. Costa and G. Figari 585

Analysis of the spin density for an excited triplet state of the permanganate ion
H. Johansen 592

Kekulé structure counts and multiple coronoid hydrocarbons
S.J. Cyvin, B.N. Cyvin and J. Brunvoll 595

On the use of adapted basis sets for variational treatments of multi-well potential surfaces
M. Foucrault, M. Picard and J.M. Leclercq 599

O^- electron stimulated desorption from O_2 in CO and N_2 matrices
R. Azria, L. Sanche and L. Parenteau 606

Optical properties of thin films of molecular semiconductors
R. Even, J. Simon and D. Markovitsi 609

On the threshold frequency of long-range interactions in physiological solutions
J.R. Grigera, F. Vericat, G. Ruderman and J.R. de Xammar Oro 615

For forthcoming papers in the Journal of Luminescence refer to the last page of this issue.
